Free computer training centre near me

No training today. I did some stretching and mobility work, and will probably ride my bike downtown for lunch to meet some people for a sushi lunch in yorkville. Ended up working late last night until 11pm to complete the third edition of the TT Secret Society newsletter. This month has a review of my trip to San Diego, an in-depth look at TT Hardcore 2K6, a sneak peak at a new private client Meathead training, and a BIG TT event announcement. You can catch a problem here = > Today's Kickbutt Mindset Tips: Happy June 1. You might as well change your life today as you can on New Year's Day... New opportunity is a matter of choice not calendar. - Dan Kennedy And today's independence tip: Stands out. These days you need to be talked about, known for something, and create a tribe that acts as your sales force, and for that to happen you have to hand over, give the fastest results, and bring ENERGY! - Bedros Keuilian, Keuilian Inc. Craig Ballantyne, CSCS, MS, CTT This content is created and maintained by a third party and imported on this page to help users provide their email addresses. You may be able to find more information about this and similar content on piano.io While computers have become a staple in many companies and schools, there are still thousands of people who are unknown and uncomfortable using a computer. They have not had the training and experience many people have had, and often they feel intimidated by the new technology that keeps popping up. You can help people overcome their fear of computers by starting a computer training center. Register the center as a business or nonprofit organization. Nonprofit registration should be used if you don't plan to monetize the operations of the Training Center, and you or others do so as a way to give back to the community. If you plan to make money outside the city center then you need to register it as a business. You can learn more about each type of registration through the IRS website. Find a facility. Once you've got the fitness center established on paper, you can find a facility to function as its physical location. If you don't have enough capital to lease or buy your own center, you can see if local colleges or community centers with computers can allow you to train people on computers in their facilities. Buy equipment. While computers are the obvious parts of the equipment needed for a fitness center, there are other things you need to buy. Desktops, chairs and software are required for the computers, while phones and office supplies will be required for your employees. Hire employees or find volunteers to train people on computers. Once the equipment is set up at your facility, you are almost ready to open to the public. However, before this day arrives, you need to hire staff or recruit volunteers to serve as teachers at your gym. Although you may need to experts if you teach advanced classes, some of the incipng computer classes can be taught by almost anyone. Market and advertise the fitness center. It's important that once your business or nonprofit is established, you'll inform the community about the services you offer. Here's a not-so-happy thought: You need to learn the essentials of HTML, or how to drill into a Microsoft Access 2000 database. The more powerful software becomes, and the more important it becomes for every part of a business, the more boring it is to learn. There may be no expression more feared by overstressed businesspeople than I am from the training department, and I'm here to teach you. Happy Computers Ltd., an aptly named software training company based in London, has tried to change all this. The company - one of the largest independent IT training facilities in the UK - is small by US standards (it only trains around 12,000 people a year). But its influence far exceeds its size: Happy has received praise from the UK's educational establishment, and the teaching methods have influenced a new certification programme adopted by the UK's Institute of IT Training. So what is the secret behind Happy's smile? According to Henry Stewart, 40, who founded Happy in 1991, IT training is not about technology - it's about people. We base everything we do on student, not on manuals, Stewart declares. In most IT training, a trainer spends 90% of his time telling and showing. We believe that you must have empathy for every person in a room. People learn best when they feel good about themselves, when they are relaxed, and when they are involved in what they learn. Walk through the doors of Happy's fitness centre in London and that philosophy is instantly visible. Café tables and chairs dot the foyer. Colorful sofas line the office walls, which are decorated with inspiring words and vivid works of art. Even the toilet paper in the rest of the rooms is pastel.

Classes run daily at 1pm for lunch (students get a buffet) and 4pm for ice cream. I've attended a couple of other seminars, but I didn't find them at all helpful, says Betty Mitchell, 61, an assistant in the service department of Cancerlink, who recently took a middle course in Microsoft Word at Happy. Tutors at Happy are all friendly and interested in you as an individual, not just because you take a day-long course. But Happy is much more than her upbeat mood. The company's training principles, a class manifesto of sorts, are a short course in what it takes for any instructor (not just a software coach) to make a lasting impression on students. The aim of a course, the manifesto says, is not only to teach the technology, but also to give students a sense of trust in themselves. The motto for students is Experiment. Ask questions. Make mistakes. Happy's course follows what they call the rule of three. Coaches encourage students to practice a new skill times: when they first learn it, in a review activity and in an independent exercise. If I tell you anything, you'll forget. If I show you, you'll remember. And if I involve you, you'll understand, Stewart says. By design, Happy holds things little: No more than six students are in a class. And a coach doesn't tell students what they need to learn. Instead, students are asked what they want to learn. A lot of people come to class with a clear goal. Before they find out anything, they may have some preconceived notions of what they want, says Cathy Callus, 39, a happy coach and recipient of the Institute of IT Training's 1999 IT Trainer of the Year award. So it's important to ask students what they want and why. We don't teach people how to use features; we teach them how to do what they want to do. Happy also keeps its classes competitive. In its course to prepare people for IT certification, Happy divides classes into two layers. Each team comes up with three review questions for the other team. Teams review the material they need to know when trying to come up with questions that will stump the other team. It relates to another of Happy's training principles: Set the stage of learning, and then get out of the way. Having established an exercise's principles and parameters, coaches are leaving their classrooms, Stewart said. People are used to dependent learning - doing what they are asked to do. Our goal is to learn from a job. We train people to train themselves. Contact Henry Stewart via email (henry@happy.co.uk), or learn more about Happy Computers online (www.happy.co.uk). Many companies are trying to bridge the digital divide by donating hardware and software to nonprofits. But these donations can leave nonprofit groups wondering what to do next. How do employees and customers use all this? Happy Computers helps these groups answer that question. Since April 2000, Happy has worked with the Central London Training and Enterprise Council to work with six agencies serving the homeless and unemployed. Giving these agencies money or hardware is a drop in the ocean, said Henry Stewart, Happy's founder. We're trying to make people more effective. Happy, which also donates 4% of its profits to charity and gives employees a paid day off each month to do volunteer work, offers nonprofits a variety of tools and services: It prepares agency workers for certification by the Institute of IT Training so they can then train homeless and unemployed people. It also offers educational nonprofits free educational materials. In addition, Happy agencies allow their space for free in the evenings and on weekends to train people. I have a core belief in the principles that this company promotes – not the technological principles, but the policies that lie behind them, says Suzy Cornwell, 33, Happy's operations manager. We operate on the premise that everyone has the right to be
